

KWANG GUAN CONG (2001411)

Milestone 3 taught me the process of software development, working on the implementation helped me understand git workflow and how we should be branching out to our own development branches. The workings of remote repository and its branches also allowed us to collaborate on codes that we needed help with.

The UAT diagrams and Whitebox testing helped me get a better grasp of the importance of testing as we go through the implementation there are certain code behaviors that we do not want. The UAT diagrams also helped me in implementation flow in the codes thus, saving time. For M3, I worked on managing the team, UAT control flow graph, Whitebox testing suite research, communication between the Robotic Car and getting live data feedback from the car using serial communication and resolving robotic car or code related issues.

Overall, I felt that our team worked well together in M3 with each of us covering areas that we fell short. With the amount of time that we had and other projects to handle, we managed to complete what we set out to do because we were able to stick to meeting time and worked efficiently on the tasks.
