In this final milestone of our project, we have put in all that we have learned throughout this trimester to produce the web portal that will meet our customer's requirements. It has been a tough journey for most of us as we must work concurrently for different features in the web portal as well as for our SE team mates whom they must also ensure that the web portal is able to communicate and work along with the robotic car. For our team, we have been communicating frequently, progressing towards the end results which we have did it. My contributions to this milestone were coding the dashboard and backend python code for the database, along with some CSS, assisted my team with the Whitebox testing and the UAT video. From what I see in this project is that we have applied the knowledge that we have learned in classroom, put it into a reality which one day I believe we will be working for the similar project with the same settings, but for real business/society purposes. This experience let us understand the importance of Software engineering knowledge such as how to work together as a team, making use of platforms such as Github, how to plan for Software requirement stages, how to do various types of testing etcetera. I am thankful for this experience.
